Acknowledgements

This report was authored by Yamei Du and Tite Habiyakare, International Labour Organization.

This report describes Kiribati's labour market in i-Kiribati. It characterizes the labour force and provides information on labour market participation by industry and occupation, including participation in primary activities such as fisheries and agriculture, and other important information on wages and work conditions. This report identifies populations that are unemployed and underemployed, and those working in conditions with low or unequal access to employment and social security, with the objective of achieving event work for all and economic growth in Kiribati.

The Kiribati National Statistics Office (KINSO) would like to acknowledge and thank the respondents to the 2019/20 Household Income and Expenditure Survey (HIES). Acknowledgement and thanks is also given to the staff of the KINSO, especially Aritita Tekaieti, HIES Manager, Tiriara Ikam, HIES Coordinator, and Agnether Lemuelu, Data Manager, as well as the Supervisors and Enumerators of the 2019/20 HIES, who were so crucial in the collection of the information labour markets in Kiribati. KINSO would like to finally thank and acknowledge our international partners, the Statistics for Development Division of the Pacific Community (Michael Sharp, Toga Raikoti, Bertrand Buffiere, Nathalie Troubat, Olivier Menaouer and Luis de la Rúa and Gaëlle Le Gall-Queguineur), who provided technical assistance to all aspects of the HIES, and to the International Labour Organization Phu Huynh and Felix Weidenkaff for their support in collecting and processing the labour market data and in undertaking the analysis presented herein.

This report was prepared with financial support of the Australian Government through ACIAR project FIS/2018/155.

Foreword

The 2019 household income and expenditure survey (HIES) of Kiribati was only the third such survey conducted by the National Statistics Office (NSO), with the previous one dating as far in 2006 and first one in 1996. The 2006 and 2019 collected significant information on the country's labour market in line with latest standards from the 19th International Conference of Labour Statisticians (ICLS) of October 2013. The HIES 2019 was implemented during a 12-month data collection period from April 2019 to March 2020.

In 2019 the International Labour Organization (ILO) and the Statistics for Development Division of the Pacific Community (SPC/SDD) developed a standard labour force module for inclusion in all HIES implemented in the Pacific Island countries. The module was approved by the Pacific Statistics Methods Board (PSMB) in May 2019, following testing implemented in Kiribati. The labour force module, which is in line with the latest international standards on labour force statistics, and provides core data on the labour force, was then included in the full HIES 2019 of Kiribati. The report on Kiribati Labour Market Monograph – Results from HIES 2019, presents results of that labour force module of the survey.

The labour market monograph provides significant information on the country's labour market situation, by presenting the analysis of demographic characteristics and labour force characteristics of Kiribati. The report presents data of the labour force, employment, informal sector and employment, wages, working time, and labour underutilization with selected main disaggregation variables such as age, sex, and urban-rural areas. The report also covers data on the population outside the labour force, including persons involved in subsistence work and household (HH) care as their main activity.

The labour market monograph 2019 provides an updated picture of Kiribati labour market, which we hope will be useful in informing a wide range of national economic and social policies, as well as the country's decent work agenda.

Executive summary

In 2019 the ILO and SPC Statistics for Development Division (SPC/SDD) developed a standard labour force module for inclusion in all HIES implemented in the Pacific island countries. The module was approved by the Pacific Statistics Methods Board (PSMB) in May 2019. Kiribati was among the first countries to implement the labour force module, which was in line with the latest international standards on labour force statistics (ILO, 2013) and provided core data on the labour force. The HIES 2019 was implemented during a 12-month period from April 2019 to March 2020.

This labour force module reports key characteristics on the country's employment-related statistics, with an aim to present a comprehensive labour market and socio-economic background. However, the full labour underutilization statistics cannot be presented as working time was not fully measured in this survey round.

Summary of key labour market indicators

The total HH population in Kiribati was estimated to be 118,480 persons, of whom, 59,984 were male and 58,496 were female. Two third (64.5%) of population were at working-age (aged 15+), totalling 76,910 persons. In addition, 27,540 persons of working-age were in the labour force, marking an overall national labour force participation rate (LFPR) of 35.8%. There were 16,353 men and 11,187 women in the labour force, resulting in an average LFPR of 43.1% for men and 28.7% for women.

In the labour force, 25,172 were in employment, of which, 59.4% (14,956 persons) were male workers and 40.6% (or 10,217 persons) were female workers. Youth (aged 15–24) made up 16.7% of all employed persons. Meanwhile, 47.6% of employed persons were informally employed. Some 2,400 persons were unemployed, marking the average unemployment rate at 8.6%. Additionally, 1,033 persons between ages 15 and 24 years were unemployed, marking the youth unemployment rate at 22.5%. Half of young men and women (49.8%) were not in employment, education or training (NEET).

1. Demographic characteristics

Chapter 1 presents the demographic characteristics of the Kiribati population. It contains the statistics of the total population in the country, population disaggregated by age groups, educational attainment, and disability incidence by sex (Table 4) and by regions (Table 5).

1.1. Demographic characteristics of the population

In 2019, Kiribati reported a total HH resident population of 118,480, amongst whom, 59,984 were men and 58,496 were women. About 57.9% of Kiribati population lived in urban areas, counting for 68,551 persons, while 42.1% (or 49,929 persons) lived in rural areas.

Looking at the educational attainment, 31.6% of the population completed the primary education, 46.4% completed the secondary studies, and only 2% reached tertiary education. It is noticeable that women had a slightly higher tertiary attainment rate (2.3%) than their male counterpart (1.8%).

With regards to the overall incidence of disability in Kiribati, it is estimated that among all persons aged 5+, 5,738 persons (4.8%) had disability. Meanwhile, women had reported a higher incidence rate of disability (5.3%) than men (4.4%).

Table 4. Population by sex, age, education and disability status

Source: 2019 Kiribati HIES.

Note: (*) Denotes small sample size of less than 30 cases.

The distribution of the total population by 5-year age band was based on the actual data collected in the HIES. Figure 1 indicates the size distribution of the age categories by males and females, respectively.

The population pyramid of Kiribati presented a large base and a small top, indicating the country has a young population. The demographic structure of the country is still at the early demographic dividend stage², while this means a relatively low

share of the working-age population at the present, it also suggests a rapid growing labour force in the future. The lower numbers in cohort 15–19 date already from the 2005 census³.

² Early population dividend stage refers to a country with increasing working-age population share.

ILO (International Labour Organization). 2018. Asia-Pacific employment and social outlook 2018: advancing decent work for sustainable development.

³ National Statistical Office (NSO). 2007. Kiribati 2005 Census Volume 2: Analytical Report. January. Available at: <https://nso.gov.ki/census/population-and-housing-census-2005/>.

Figure 1. Population pyramid by age

Source: 2019 Kiribati HIES.

2. Labour force and labour force participation rate

Chapter 2 presents statistics of the working-age population, labour force, and population outside of the labour force by sex (Table 6) and by regions (Table 7). This chapter also displays information about the labour force disaggregated by age group and by educational attainment.

2.1. Economic activity rate

The working-age population refers to persons who are aged 15+. The total working-age population in Kiribati was estimated to be 76,910 persons, representing 64.9% of total population. Among those persons of working-age, 25,540 were in the labour force (previously known as the economically active population).

The overall labour force participation rate (LFPR) in Kiribati was 35.8%, and was low compared to the average Pacific regional rate of 62.7%⁴. Table 3.1 shows a noticeably higher LFPR for male than that for female. While 16,353 (or 43.1%) men of working-age were in the labour force, only 11,187 (or 28.1%) working-age were in the labour force. Among those who reported reasons for economic inactivity,

more than half were due to HH care responsibility (see details in Chapter 8) and skill mismatches.

The LFPR in Kiribati presented an inverse-U shape (Fig. 2), with the labour force concentrated among persons between ages 25 and 55-years. Men had higher LFPR than women in all age groups.

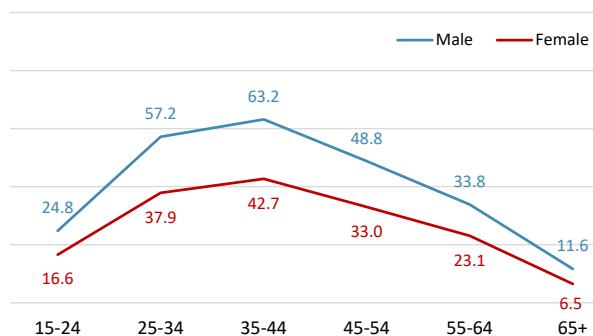

Figure 2. Labour force participation rate (%) by sex and age group

Source: 2019 Kiribati HIES.

South Tarawa, the region that counted for more than half of total working-age population in the country, had the highest LFPR rate of 42.8%. The labour force in the rest of the country was less than 33% (Table 7).

Note: (*) Denotes small sample size of less than 30 cases.

More than two-thirds (68.5%) of the Kiribati labour force were concentrated in urban areas, totalling 18,867 persons. The LFPR of urban areas was 42.1%, which was considerably higher than in rural areas (27%). Meanwhile, gender gaps were salient when disaggregating labour force by urban-rural split. While half of men from urban areas participated in the labour force, only one in five women from rural areas were active in the labour market (Fig. 3).

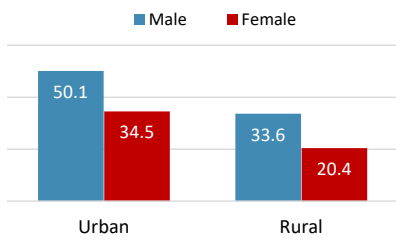

Figure 3. Labour force participation rate (%) by sex and geographic location
 Source: 2019 Kiribati HIES.

2.2. Labour force by educational attainment

In terms of labour force distribution by the highest level of educational attainment, it is estimated that more than three quarters of the Kiribati labour force reached secondary education as their highest level of attainment (76.2%), 15.7% had primary education or less, and only 7.1% reached tertiary education (Fig. 4).

Figure 4. Distribution of labour force by educational attainment (%)
 Source: 2019 Kiribati HIES.

The share of female labour force who completed secondary or higher education was greater than the male labour force. Specifically, 88.2% of female labour force completed secondary or higher education, while the share of those among male labour force was 80%. The gender gap became larger

when it comes to the tertiary education. While one in ten women in the labour force received tertiary study, only one in twenty men in the labour force reached this level of study (Fig. 5).

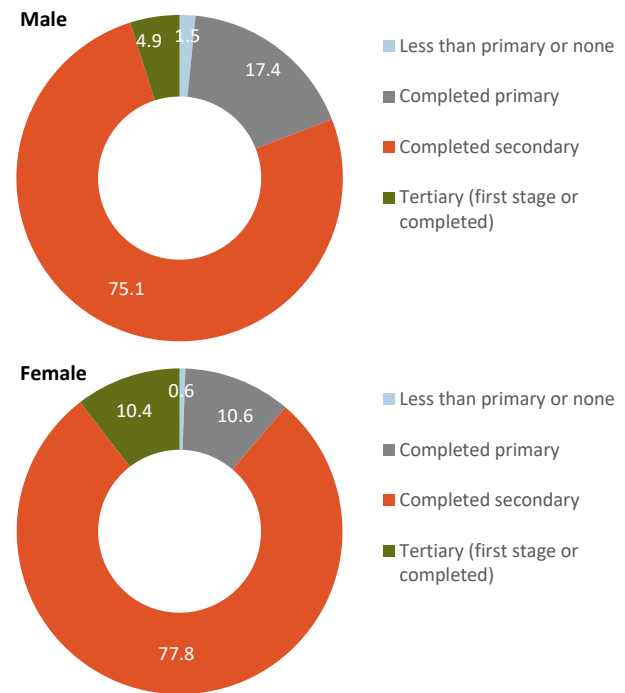

Figure 5. Distribution of labour force by sex and educational attainment (%)
 Source: 2019 Kiribati HIES.

The LFPR increased as the level of educational attainment raised. The LFPR for tertiary, secondary, primary, and less than primary level was 80.6%, 38.4%, 24.3%, and 12.9%, respectively. Receiving tertiary education substantially increased the labour force participation, especially for women. The LFPR of women with tertiary education was 84.7%, which was three times as much as it is for women with lower educational attainment. Finally, women with tertiary education also had a higher LFPR than men with the same educational attainment (Fig. 6).

2.3. The population outside the labour force

The population outside the labour force is defined as people who are neither in employment nor in unemployment, including students, old age, and those engaged in unpaid HH or family duties. Shown in Table 8, 49,370 persons (or 64.2%) of working-age in Kiribati were outside the labour force. Women were more likely to be outside the labour force. Specifically, it is estimated that there were 27,812 (or 71.3%) women and 21,558 (or 56.9%) men of working-age outside of labour force.

By educational attainment, persons with higher education were less likely to be outside of labour force. On average, 87.1% of working-age population with less than primary education were outside labour force, comparing to 19.4% of working-age population with tertiary education who were outside labour force.

Table 8. Working-age pop. outside the labour force by age group and educational attainment

3. Employment

Chapter 3 presents the statistics of the employed population by sex (Table 9) and by regions (Table 10). The employed population is defined as all persons of working-age (15+ years) who, during a specified reference period (seven days prior to the survey), were engaged in any activities to produce goods or provide services for pay or profit.

3.1. Employment and its main classifications

In Kiribati, the total employed population was estimated to be 25,172 persons, representing 32.7% of the working-age population. Among those employed persons, 59.6% were men (14,956 persons) and 40.6% were women (10,217 persons). Disaggregated by age group, 14.2% or 3,562 persons were youth (aged 15–24), 85.8% or 21,610 persons were aged 25+.

Employment-to-population ratio

In Kiribati, the majority of the working-age population was outside of the labour force (Table 4.3), leading to a rather low employment-to-population ratio (EPR) of 32.7%. The employment-to-population ratio was higher in the urban areas (38.3%) than it in the rural areas (25%).

In both urban and rural areas, women had lower EPR than men. By main regions, South Tarawa had the highest EPR at 38.8%, while all the other regions had all less than 30% of EPR (Table 11).

Figure 7 shows that half of men in urban areas were in the labour force, and this group also had the highest EPR (45.6%). Meanwhile, only one in five women from rural areas were in the labour force.

Table 11. Population in employment, unemployment or outside the labour force, by sex and geographic location

		Labour force status		
		Employed	Unemployed	Outside the labour force
Kiribati	Male	14,956	1,397	21,558
	Female	10,217	970	27,812
	Total	25,172	2,368	49,370
Urban	Male	9,956	996	10,895
	Female	7,189	725	15,010

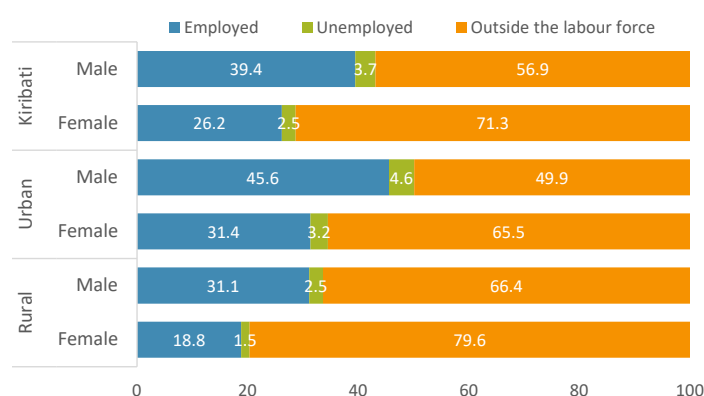

Figure 7. Share of population in employment, unemployment or outside the labour force by sex and geographic location (% in the working-age population)

Source: 2019 Kiribati HIES.

3.2. Employment by economic activity

“Services” was the largest sector in terms of employment. It employed 18,676 workers, representing 74.2% of total employment. “Agriculture, forestry, and fishery” employed 4,264 workers, adding up to 16.9% of employed population. “Industry” employed 2,232 works, counting for 8.9% of total employment (Fig. 8).

Figure 8. Employment by economic sector (% distribution)

Source: 2019 Kiribati HIES.

In all sectors, there were more male workers than female workers (Fig. 9). Respectively, the share of female workers in “Agriculture, forestry and fishery”, “Industry”, and “Services” sectors were 11.7%, 32%, and 48.2%. Women were more likely to be employed in the “Services” sector than men – 88.1% of female workers were in the “Services” sector, while 64.7% of male workers were in the same sector.

Figure 9. Employment by economic sector and sex
Source: 2019 Kiribati HIES.

3.3. Employment by status in employment

The majority (67.3%) of employed persons in Kiribati worked as employees, followed by own-account workers (18.8%), contributing family workers (6.8%),

and employers (1.9%). More than 70% of male workers were employees, compared to 62.7% of female workers (Fig. 10). Consequently, women were more likely to be self-employed (34%) than men (23.1%).

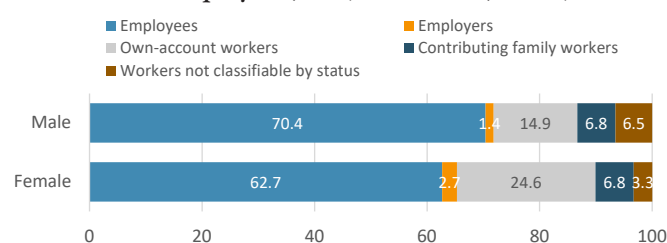

Figure 10. Status in employment by sex (% distribution)

Source: 2019 Kiribati HIES.

The labour market varied between urban and rural areas. In urban areas, 76.3% of employed persons were employees, while in rural areas less than half workers were employees (47.9%). Meanwhile, there were more own-account workers in rural areas (2,781 workers or 34.6% of rural employment) than it in urban areas (1,959 workers or 11.4% of urban employment).

4. Unemployment

Chapter 4 presents statistics of the unemployed population and the youth not in employment, education, or training (NEET). Statistics on the composite labour underutilization are not included in this report, as the measurement of working time was not sufficient enough to derive data on time-related underemployment.

4.1. Unemployment rate

Unemployed persons refer to those of working-age who are: a) without work during the reference period (seven days prior to the survey); b) currently available for work (for either paid wage employment or self-employment); and c) seeking work⁵.

It is estimated that there were 2,368 persons unemployed in Kiribati, resulting to an overall unemployment rate of 8.6% (Table 12). The youth (aged 15–24) unemployment rate was 22.5%, which was higher than the unemployment rate of people at other age groups.

4.2. Youth not in employment, education or training (NEET)

It is estimated that 10,967 youth, who were aged 15-24, were not in employment, education, or training (NEET), representing 49.8% of youth in Kiribati. More than half (50.6%) of young men were NEETs, and 48.9% of young women were NEET. There was a lower NEETs incidence rate in urban areas (44.9%) than it in rural areas (56.2%).

5. Informal sector and informal employment

Chapter 5 presents statistics of persons employed in the informal sector and persons with informal employment.

Employment in the informal sector comprises all jobs in informal sector enterprises, or persons who, during a given reference period (seven days prior to the survey), were employed in at least one informal sector enterprise, irrespective of their status in employment and whether it was their main or a secondary job. A formal sector enterprise is defined in this report as either a public enterprise, or a private enterprise that is registered or has full bookkeeping for national reporting. In this report employment in the informal sector refers to main job only.

Informal employment combines both the enterprise-based concept of informal sector and a job-based concept of employment informality. Employees are considered to have informal jobs if their employment relationship is, in law or in practice, not subject to national labour legislation, income taxation, social protection or entitlement to certain employment benefits. In this report, employees are considered as having a formal job if the employer contributes to a national pension or social protection system on their behalf, or if they received both paid sick leave and paid annual leave.

Informal employment can be carried out in formal sector enterprises, informal sector enterprises, or HHs. The informal employment rate is a key indicator of the quality of employment in an economy.

5.1. Employment in the informal sector

In Kiribati, 4,459 workers were employed in the informal sector, representing 17.7% of total employment (Table 17). The share of male workers (18%) in the informal sector was slightly higher than that of female workers (17.3%). Youth (18.4%) had a slightly higher rate of employment in the informal sector than adults (17.6%).

The share of employment in the informal sector went up as workers' educational attainment decreased. On average, 8.2% of workers with tertiary education were employed in the informal sector, while 16.9%

of workers who completed secondary education were employed in the informal sector. And the rate of employment in the informal sector went up to 26.1% among those who had primary education or lower.

Note: (*) Denotes small sample size of less than 30 cases.

By economic activities, jobs in “Agriculture, forestry and fishery” experienced the highest share of employment in the informal sector at 31.9%, followed by 21.9% in “Industry” and 14% in “Services”. Women were more likely to be employed in the informal sector in “Industry” and “Services” than men.

It is also worth noticing that some 4,300 persons were employed in HHs, making up 17% of total employment. Female workers were more likely to be employment in HHs (at 19.5%) than their male counterpart (15.2%). Much like workers in the informal sector, workers who worked in HHs also had high incidence of informal employment (see Table 19 for details).

5.2. Informal employment

About half (47.6%) of the workers in Kiribati were informally employed with male workers more likely to be in informal employment than female workers (Table 18). Youth had a higher rate (61.7%) of informal employment than adults (45.3%).

By educational attainment, the informal employment rate among workers with tertiary education level was the lowest at 12.2%. Women with tertiary education level had lower informal employment rate than men. The informal employment rate increased to 46% among workers with secondary education, and to 73.5% for those who had primary education or lower.

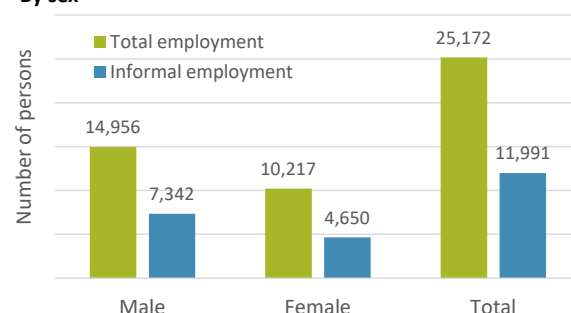

In terms of economic activities, the vast majority of those working in “Agriculture, forestry and fishery” were informally employed (82.2%), compared to 56.3 in “Industry” and 38.7% in “Services”. Women were more likely to be in informal employment in “Industry” and “Services” than men.

By sex**By age group****By education attainment****By economic sector****Figure 14.** Number and share of informal employment by sex, age group, educational attainment, and economic sector

Source: 2019 Kiribati HIES.

Table 19 presents the joint distribution of the informal sector and informal employment. One in five (21.2%) workers in the formal sector had informal jobs, totalling 3,479 workers. These are essentially workers employed in paid jobs in the formal sector but on an informal basis, such as, temporary employment without social protection coverage.

Men in the formal sector were more likely to be informally employed than women. One fourth of male workers in the formal sector were in informal employment, while 14.9% of female workers in the formal sector were informally employed.

6. Wages

Chapter 6 presents information on wages from the main job of employees by sex (Table 20) and by region (Table 21).

In this report, information on income (wages and salaries) was analyzed for employees in their main job, combining both in cash and in kind payments. Where information on earnings in the main job was not paid on a monthly basis, it was converted into a monthly basis. All amounts were recorded in Australian dollars (AUD), the local currency of Kiribati.

6.1. Average monthly wages in the main job of employees

The average monthly wage of paid employees in Kiribati was estimated at AUD499. Male employees earned AUD548, which was considerably higher than what female employees earned, at AUD419, flagging an average gender pay gap of 23.5% in the country.

Source: 2019 Kiribati HIES.

Notes: 1. (*) Denotes small sample size of less than 30 cases.

2. (**) High averages influenced by only few cases earning above AUD2,000 per month.

As indicated in the notes of the tables above high earnings averages in agriculture are influenced by few cases earning about AUD2,000 and above. However, one may also note that some agricultural activities are indeed better paid in Kiribati, such as copra sales, and fishing and selling marine products. These cases although being somehow outliers, were not removed from the analysis as they may be reflecting a real situation in agriculture.

By age group, male employees aged 25+ in urban areas earned the highest monthly wage (AUD638) among all age groups, while female youth in rural areas earned the lowest monthly wage at AUD321. On average adults earned a higher monthly wage than youth in all groups, except for male employees in rural areas (Fig. 15).

Figure 15. Average monthly wage (in AUD) main job, by sex, age group, and geographic location

Source: 2019 Kiribati HIES.

By economic sector, the highest average monthly wage came from employees in “Agriculture, forestry and fishery” (AUD919), where male employees’ wage was more than three times higher than female employees. The average monthly wage in “Industry” was AUD470, followed by “Services” at AUD450.

By occupation, skilled agricultural, forestry and fishery employees had the highest average monthly wage at AUD1,127. Male employees on average earned more than female employees in all occupation except those who were technicians and

associate professionals and clerical support workers (Fig. 16). However one may need to remember that the conclusions above for agriculture are influenced by few special cases earning AUD2,000 and more in the sector.

7. Main activity status and subsistence work

Chapter 7 presents statistics on the main activity status of the working-age population, as well as an estimation of persons involved in subsistence work. The results on the main activity status question reflect a self-assessment of the working-age population, i.e. a more social assessment of what people recognize as their main activity status at present.

7.1. Main activity status

Among 76,910 working-age population in Kiribati, 38,955 persons (or 50.7%) declared themselves mainly engaged in care works in HH or family. About 17,256 persons self-declared engaging in work other than HH care, namely, working in farming, raising animals or handicraft, working in fishing and gleaning seafood, working in government, NGO or private sector, and volunteer work, representing 22.4% of the working-age population (Table 22).

The share of women who self-declared taking care of HH or family as their main activity (57.1%) was higher than that of men (44%), while the share of women (16.9%) who self-declared to be mainly involved in work other than HH care was lower than that of their male counterpart (28.1%).

Table 22. Main activity status by sex (% in the working-age population)

	Male	Female	Total
Total working-age population	37,910	39,000	76,910
Main activity status			
Studying or training	8.5	10.4	9.4

Other activity	3.6	2.9	3.3

Source: 2019 Kiribati HIES.

Note: (*) Denotes small sample size of less than 30 cases.

Of 22,030 young persons, 3,891 (or 17.7%) were looking for work, while the share among adults (aged 25+) was only 5.2% (Table 23). Taking care of the HH or family was the activity with most persons engaged across all age groups.

By geographic location, the share of working-age population who self-declared taking care of the HH or family as their main activity was higher in rural areas (62%) than that of those in urban areas (42.5%).

People who self-declared conducting work other than HH care as their main activity were concentrated in urban areas. About three quarters (75.3%) of working-age population mainly conducting work other than HH care were in urban areas, totalling 12,999 persons, while only 4,257 persons (or 24.7%) of those were in rural areas. What's more, 29% of working-age population from urban areas were in work other than HH care. This share was higher than their counterpart in rural areas at 13.2%.

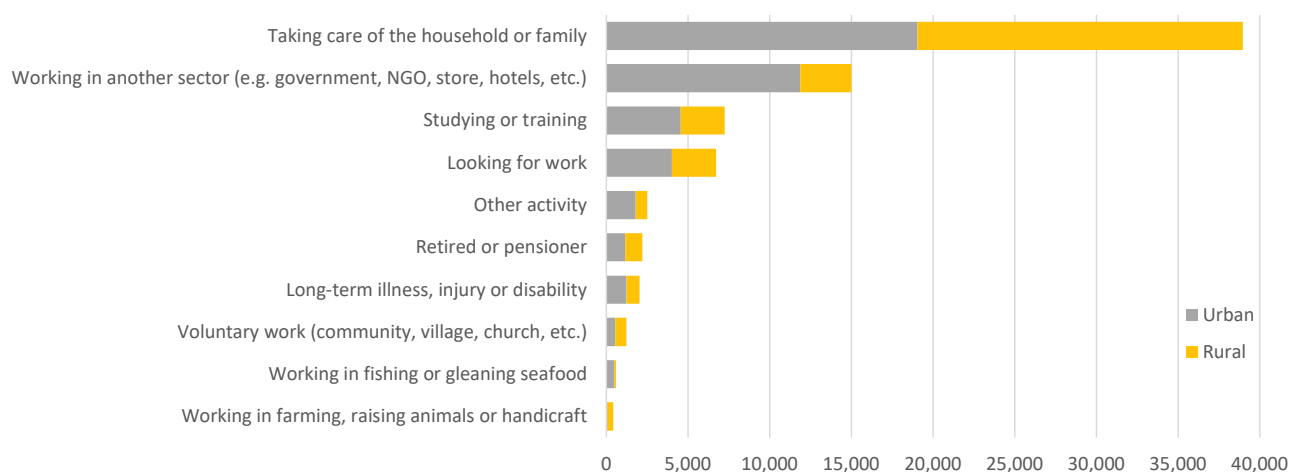

Figure 17. Main activity status by geographic location

7.2. Main activity status and labour force status

Table 25 indicates all self-declared main activities can be conducted by persons under all three labour force status, with the exception of those working in non-farm sector - they are considered as employed by definition. Almost all (92.7%) of persons of working-age working in agriculture and fishing as their main

activity were employed. And only 16.3% of working-age population who declared HH care as their main activity were employed.

As seen earlier, women were more involved in HH care activities than men were. Those women who self-reported HH care as their main activity also represented 29.2% of total women employment, against 22.4% for their male counterpart (Table 26).

7.3. Subsistence work and household care

The 19th International Conference of Labour Statisticians (ICLS) introduced a technical term of own-use production work to define all inputs of labour involved in production of goods and services for own final use by the family. This concept includes the type of work that is commonly accepted as subsistence work and the provision of services which is also known as HH care work.

In this HIES, subsistence work included farming, fishing, and manufacturing of other goods for own use. In Kiribati, about 0.1% (or 75 persons) of working-age population have self-reported conducting subsistence work as their main activity.

Some 32,622 persons of working-age were exclusively involved in unpaid HH care, accounting for 42.4% of the working-age population. There were 19,280 women (or 49.2% of women in the working-age population), and 13,342 men (or 35.2% of men) engaged in unpaid HH care (Table 27).

Table 27. Subsistence work and household care by sex (% in the working-age population)

	Male	Female	Total
Subsistence work	0.2*	0.0*	0.1*
Household or family care	35.2	49.4	42.4
By age group			
15–24	32.9	35.6	34.2
25+	36.2	54.5	45.7
25–64	36.0	55.3	45.9

Level not stated	36.4*	43.2*	39.2

Source: 2019 Kiribati HIES.

Note: (*) Denotes small sample size of less than 30 cases.

By age groups, women between 25 and 64 years were the largest group engaged in unpaid HH care. More than half of women (55.3%) in this age group

were involved in unpaid HH care compared to 36% of men. Moreover, more than one third (34.2%) of young people at age 15–24 were involved in unpaid HH care (Fig. 18).

Figure 18. Numbers of male and female self-reporting household care as their main activity by age group

Source: 2019 Kiribati HIES

By urban-rural split, the number of working-age population who were in unpaid HH care were estimated to be similar, with 16,126 persons from urban areas and 16,494 persons in rural areas. However, the share of working-age population in rural areas who were in HH or family care was 51.3%, which was much higher than it is among those in urban areas (36%). In summing up, 32,697 persons in Kiribati were involved in subsistence work and HH or family care, representing 42.5% of total

working-age population (see details in Appendices, Table A.4.5). The share of women (49.4%) in subsistence work and unpaid HH care was higher than that of men (36.3%). This was the case across all age groups (Fig. 19).

Appendices

A.1. Main labour force statistical concepts and definitions

The labour force module of the Kiribati HH Income and Expenditure Survey 2019 was designed in accordance with the international standards on statistics of work, employment, and labour underutilization adopted by the 19th International Conference of Labour Statisticians (ILO, 2013)⁶. The main concepts and definitions used in this report are therefore in line with these standards and summarized below.

A.1.1 Labour force statistics concepts

Work

Work is defined as:

- “Any activity performed by persons of any sex and age to produce goods or to provide services for use by others or for own use”
- It is “irrespective of its formal or informal character or the legality of the activity.”
- It excludes “activities not involving production of goods or services (begging, stealing), self-care (personal grooming, hygiene) and activities that cannot be performed by another person on one’s own behalf (sleeping, learning, own recreation).”

Employment

Persons in employment are defined as all of those above a specified age who, during a specific reference period, were engaged in any activity to produce goods or provide services for pay or profit. It excludes persons engaged solely in activities to produce goods or services for own final use such as producing agricultural, fishing and gathering products for own-consumption or cleaning, decorating, gardening and maintaining one’s own dwelling or premises, durables and other goods.

Persons in employment comprise:

- (a) employed persons at work, i.e., who worked in a job for at least one hour;

- (b) employed persons not at work due to temporary absence from a job, or due to working-time arrangements, such as shift work, flexi-time and compensatory leave for overtime.

Unemployment (U)

The international standard definition of unemployment should satisfy three criteria simultaneously: “without work”, “currently available for work” and “seeking work”. The “unemployed” comprise all persons of working-age who during the reference period were:

- (a) without work – not in paid employment nor self-employed;
- (b) currently available for work – available for paid employment or self-employment during the reference period;
- (c) seeking work – had taken specific steps in a specified reference period to seek paid employment or self-employment.

The definition of unemployment provides an exception in the case of future starters. They are considered as unemployed even if they did not carry out activities to seek employment during the specified period.

Youth vs. adult

The term “youth” refers to persons aged 15–24 years and “adult” is persons aged 25+.

Time-related underemployment (TRU)

Persons in time-related underemployment are defined as all persons in employment who, during a specified reference period:

- (a) wanted to work additional hours;
- (b) whose working time in all jobs was less than a specified hour threshold;
- (c) who were available to work additional hours given an opportunity for more work;

⁶ International Conference of Labour Statisticians (ICLS). (2013). Resolution Concerning Statistics of Work, Employment, and Labour Underutilization. In 19th International Conference of Labour Statisticians. Geneva, October.

In the Kiribati HIES, the underemployment threshold was set at 40 hours usually worked per week.

Potential labour force (PLF)

Potential labour force is defined as all persons of working-age who, during the reference period, were neither in employment nor in unemployment but who were considered as:

- unavailable jobseekers – who were seeking employment but not currently available; or
- available potential jobseekers – who wanted employment, were currently available for employment but did not carry out activities to seek employment.

Labour underutilization

Labour underutilization (LU) “refers to mismatches between labour supply and demand, which translate into an unmet need for employment among the population” (ILO, 2013; Resolution I, Para 40). LU comprises three main components: time-related underemployment, unemployment, and potential labour force.

Figure 20 illustrates the relationship of aforementioned concepts.

Working-age Population (WAP)

The working-age population comprises persons who are aged 15+.

$$WAP \text{ (aged 15+)} = LF \text{ (Labour Force)} + NLF \text{ (Not in labour force)}$$

Labour Force (LF)

The total labour force is the sum of the total of employed and unemployed population of the working-age population.

$$LF = E \text{ (Employed)} + U \text{ (Unemployed)}$$

Population outside of the labour force

Population outside of the labour force are persons of the working-age who are not part of the labour force. It also refers to the working-age population who are neither employed nor unemployed.

Labour Force Participation Rate (LFPR)

Labour force participation rate is defined as the ratio of the labour force to the working-age population (aged 15+). It is a measure of the proportion of working-age population that actively engages in labour market, either by working or looking for work.

$$LFPR = \frac{LF}{WAP}$$

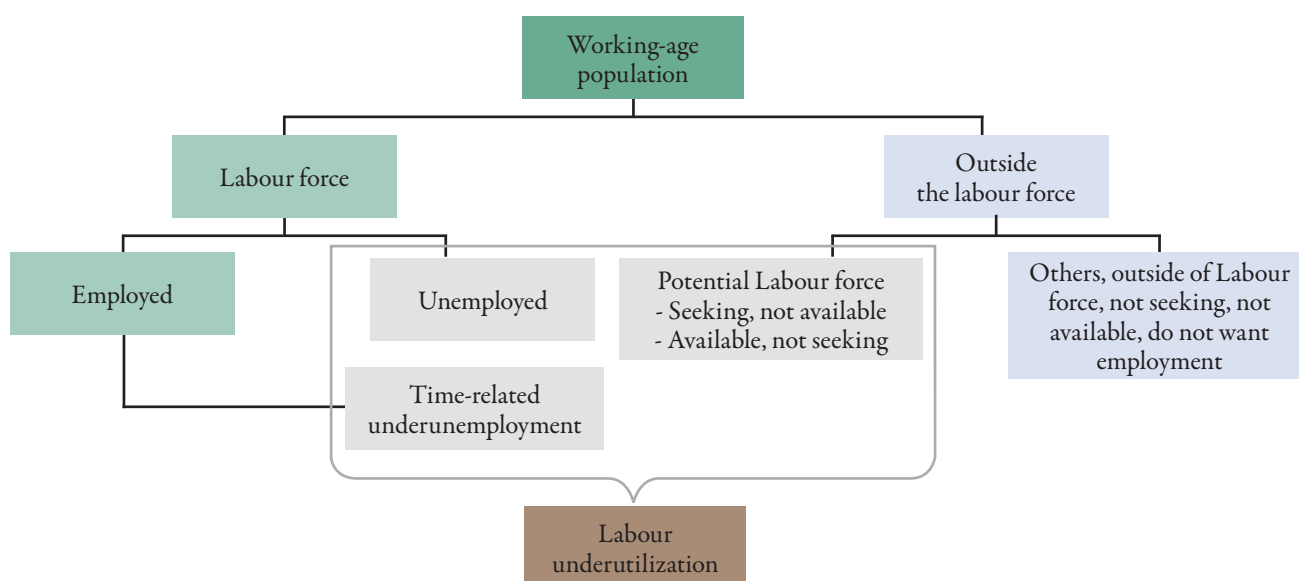

Figure 20. Components of Labour Underutilization relating to insufficient labour absorption

Employment to Population Ratio (EPR)

The employment-to-population ratio is defined as the proportion of employed population to the working-age population. A high ratio means that a large share of a country's population is employed, while a low ratio means that a large share of the population is not directly participated in economic activities, as they are either unemployed or out of the labour force.

$$LU = \frac{\text{Employed population}}{WAP}$$

Unemployment Rate (UR or LU1)

Unemployment rate is the proportion of unemployed population to the total population in labour force.

$$LU = U + TRU + PLF$$

Informal sector

The informal sector consists of unregistered and/or small unincorporated private enterprises engaged in the production of goods or services for profits. It consists of all economic units (business enterprises) that are not covered or not fully covered by formal requirements by law; or informal arrangements in practice.

In this report, a formal sector enterprise is defined as either a public enterprise, or a private enterprise that is registered (with a national businesses registration system) or has full bookkeeping for national reporting.

Employment in the informal sector contains all jobs in informal sector enterprises.

Informal employment

Informal employment is defined as the type of employment where the diversified set of economic activities, enterprises, jobs, and workers are not regulated or protected by the government, have no explicit or written contracts of employment, no certain employment benefits (such as social protection coverage, severance pay, paid sick and annual leave) or for which labour regulations are not applied nor enforced.

Informal employment comprises all persons with informal jobs, whether carried out in formal or

informal sector enterprises, or in HHs, during a given reference period, which includes:

- Own-account workers (self-employed with no employees) in their own informal sector enterprises;
- Employers (self-employed with employees) in their own informal sector enterprises;
- Contributing family workers, irrespective of type of enterprise;
- Members of informal producers' cooperatives (not established as legal entities);
- Employees holding informal jobs as defined according to the employment relationship (in law or in practice, jobs not subject to national labour legislation, income taxation, social protection or entitlement to certain employment benefits (paid annual or sick leave, etc.);
- Own-account workers engaged in production of goods exclusively for own final use by their HH.

In this report, employees are considered as having a formal job if the employer contributes to a national pension or social protection system on their behalf, or if they received both paid sick leave and paid annual leave.

Subsistence production

Subsistence production constitutes the subgroup of persons who performed any of the specified activities to produce foodstuff from farming, fishing, raising animals, fishing, or making handicraft that contribute to the livelihood of the HH or family. Excluded are persons who engaged in such production as recreational or leisure activities.

Reference period

For the employment section, the reference period is a week prior to the interview.

A.1.2 Main classifications used in this report

Status in employment

Status in employment is classified in accordance with the International Classification of Status in Employment of 1993 (ICSE-93), namely:

- Status in employment is classified in accordance with the International Classification of Status in Employment of 1993 (ICSE-93), namely:
- Wage and salaried employee – a person who works in any economic unit such as the government department, private business enterprises or organizations, including family businesses, and receives regular pay;
- Employer – a person who runs a business on his/her own or in partnership and engages at least one paid employee on a continuous basis in operating the business;
- Own account worker – a person who runs a business on his/her own or in partnership but does not engage any paid employee on regular basis (self-employed and not employing others);
- Contributing family worker – a person who works in his/her family business without receiving any regular pay.

Employment by economic sectors

Economic sectors are defined in line with the International Standard Industrial Classification of All Economic Activities (ISIC Rev.4, of 2008), which classifies economic sectors according to the activity they carry out.

Employment by occupation

The kind of work or group of tasks done during the reference period by the person employed, classified according to the International Standard Classification of Occupations (ISCO-08, of 2008).

A.2. Detailed survey methodology

A.2.1 Introduction

HIES is a statistical exercise to collect data on Household Income from all sources of income and the expenditure of the HH.

A.2.2 Objectives and contents of the report

Objective

HIES collects a wealth of information on HH expenditure, income, own account production and consumption. HIES also collects information on sectoral and thematic areas, such as gender, education, health, labour, primary activities, transport, information and communication and cash transfers and remittances.

The HIES data will be used to:

- derive expenditure weights for the revision of the Consumer Price Index (CPI);
- supplement the data available for use in compiling official estimates of various components in the System of National Accounts; and
- gather information on welfare and food security in Kiribati.

The data will inform indicators under the United Nations Sustainable Development Goals (SDGs) and to guide social and economic policy.

HIES method

The HIES was implemented over an 11-month period, from May 2019 to March 2020. The survey was implemented over such a long period to capture seasonal fluctuations in income, expenditure, consumption and production patterns.

The survey scope was all occupied HH in Kiribati.

Sampling

The sampling approach was two stage stratified sampling. The sample was designed for the reporting of expenditure aggregates by the five groups of islands of Kiribati (South Tarawa – also the urban region of the country, Northern, Central, Southern

and Line Is. and Phoenix). The sample was designed based on the results of the previous HIES that was conducted in Kiribati in 2006.

The 2018 HH Listing of Kiribati served as the sampling frame. Enumeration Areas (EAs) were the Primary Sampling Unit (PSU) and they were selected by probability according to size.

The HIES sampling approach was designed to generate reliable results at the following levels:

- National: total HH income and expenditure.
- Urban and rural: total HH income and expenditure, by urban and rural areas. South Tarawa being the main urban centre in Kiribati.
- Division (group of islands): total HH income and expenditure, by the five groups of islands in Kiribati. Fieldwork was carried out by 5 enumeration teams under the management of Kiribati National Statistics Office.

The questionnaire was administered via face to face interview with data entry via CAPI using Survey Solutions CAPI software. The questionnaire was divided into 20 main modules and an additional 3 other modules.

HIES characteristics

The final response of 2,182 HH sample represents 12.2% of the HH population in Kiribati.

Sampling weights have been generated and all results presented herein are weighted, unless otherwise specified. The probabilistic sampling weights derived from the HIES were adjusted to match the projected population structure by age and sex.

Further information on the Kiribati 2019/20 HIES is available here: <https://microdata.pacificdata.org/index.php/catalog/760>

Table A.4.7. Summary of SDG indicators from labour force module of HIES 2019-2020

SDG Indicator	Male	Female	Total
INDICATORS FOR WHICH ILO IS THE CUSTODIAL AGENCY OR INVOLVED			
1.1.1 Proportion of the population living below the international poverty line by sex, age, employment status and geographic location (urban/rural)			
3.1 Participation rate of youth and adults in formal and non-formal education and training in the previous 12 months, by sex			
5.5.2 Proportion of women in managerial positions		40.2	
8.2.1 Real GDP per employed person			
8.3.1 Proportion of informal employment in total employment, by sector and sex			
By sex	49.1	45.5	47.6
By economic activity			
Agriculture, forestry and fishery	82.7	78.3	82.2
Industry	47.3	75.5	56.3
Services	36.3	41.3	38.7
8.5.1 Average hourly earnings of employees, by sex, age, occupation and persons with disabilities			
8.5.2 Unemployment rate, by sex, age and persons with disabilities			
By sex	8.5	8.7	8.6
By age			
15–24	21.2	24.6	22.5
25–64	6.0	5.8	5.9
65+	0.0	0.0	0.0
By disability status			
With any disability	12.1	10.8	11.4
No disability	8.5	8.6	8.5
8.6.1 Proportion of youth (aged 15–24 years) not in education, employment or training	50.6	48.9	49.8
OTHER EMPLOYMENT RELATED SDG INDICATORS			
9.2.2 Manufacturing employment as a proportion of total employment	4.2	6.6	5.2
