

Fiji CLIMATE CHANGE FACTS

1

From surveys of over 800 communities in Fiji, approximately 600 have been found to be vulnerable to the impacts of climate change

2

The annual rainfall for Fiji has increased by approximately 0.65mm/year (approximately 0.03%/year) *(Fiji Meteorological Services)*

3

The intensity and frequency of days of extreme rainfall are projected to increase over the course of the 21st century *(Australian Bureau of Meteorology and CSIRO, 2011)*

4

The average warm season maximum temperature has increased by 1.2°C over the last decade

5

The intensity and frequency of days of extreme heat are projected to increase over the course of the 21st century *(Australian Bureau of Meteorology and CSIRO, 2011)*

6

Increase in mean sea-level is projected to continue

7

Ocean acidification is projected to continue
